Modeling

- A *database* can be modeled as:
 - a collection of entities,
 - relationship among entities.
- An **entity** is an object that exists and is distinguishable from other objects.
 - Example: specific person, company, event, plant
- Entities have **attributes**
 - Example: people have *names* and *addresses*
- An **entity set** is a set of entities of the same type that share the same properties.
 - Example: set of all persons, companies, trees, holidays

Entity Sets *instructor* and *student*

instructor_ID instructor_name

76766	Crick
45565	Katz
10101	Srinivasan
98345	Kim
76543	Singh
22222	Einstein

instructor

student-ID student_name

98988	Tanaka
12345	Shankar
00128	Zhang
76543	Brown
76653	Aoi
23121	Chavez
44553	Peltier

student

Attributes

- An entity is represented by a set of attributes, that is descriptive properties possessed by all members of an entity set.
 - Example:
instructor = (ID, name, street, city, salary)
course = (course_id, title, credits)
- **Domain** – the set of permitted values for each attribute
- **Attribute types**:
 - **Simple** and **composite** attributes.
 - **Single-valued** and **multivalued** attributes
 - Example: multivalued attribute: *phone_numbers*
 - **Derived** attributes
 - Can be computed from other attributes
 - Example: age, given *date_of_birth*

Composite Attributes

composite
attributes

component
attributes

- *Single-valued and multi-valued attributes*
 - Attribute have a single value at a time.
 - Multi valued attribute can have multiple value at a time for same instance.
 - E.g. *phone-numbers*
- *Derived attributes*
 - Can be computed from other attributes
 - E.g. *age*, given date of birth
 - An attribute can take a null value. That is the value does not exist for an entity instance.
 - Sometime **null** value consider as unknown value. Unknown value may be either missing or not known.

Relationship Sets

- A **relationship** is an association among several entities

Example:

44553 (Peltier) advisor 22222 (Einstein)
student entity relationship set instructor entity

- A **relationship set** is a mathematical relation among $n \geq 2$ entities, each taken from entity sets

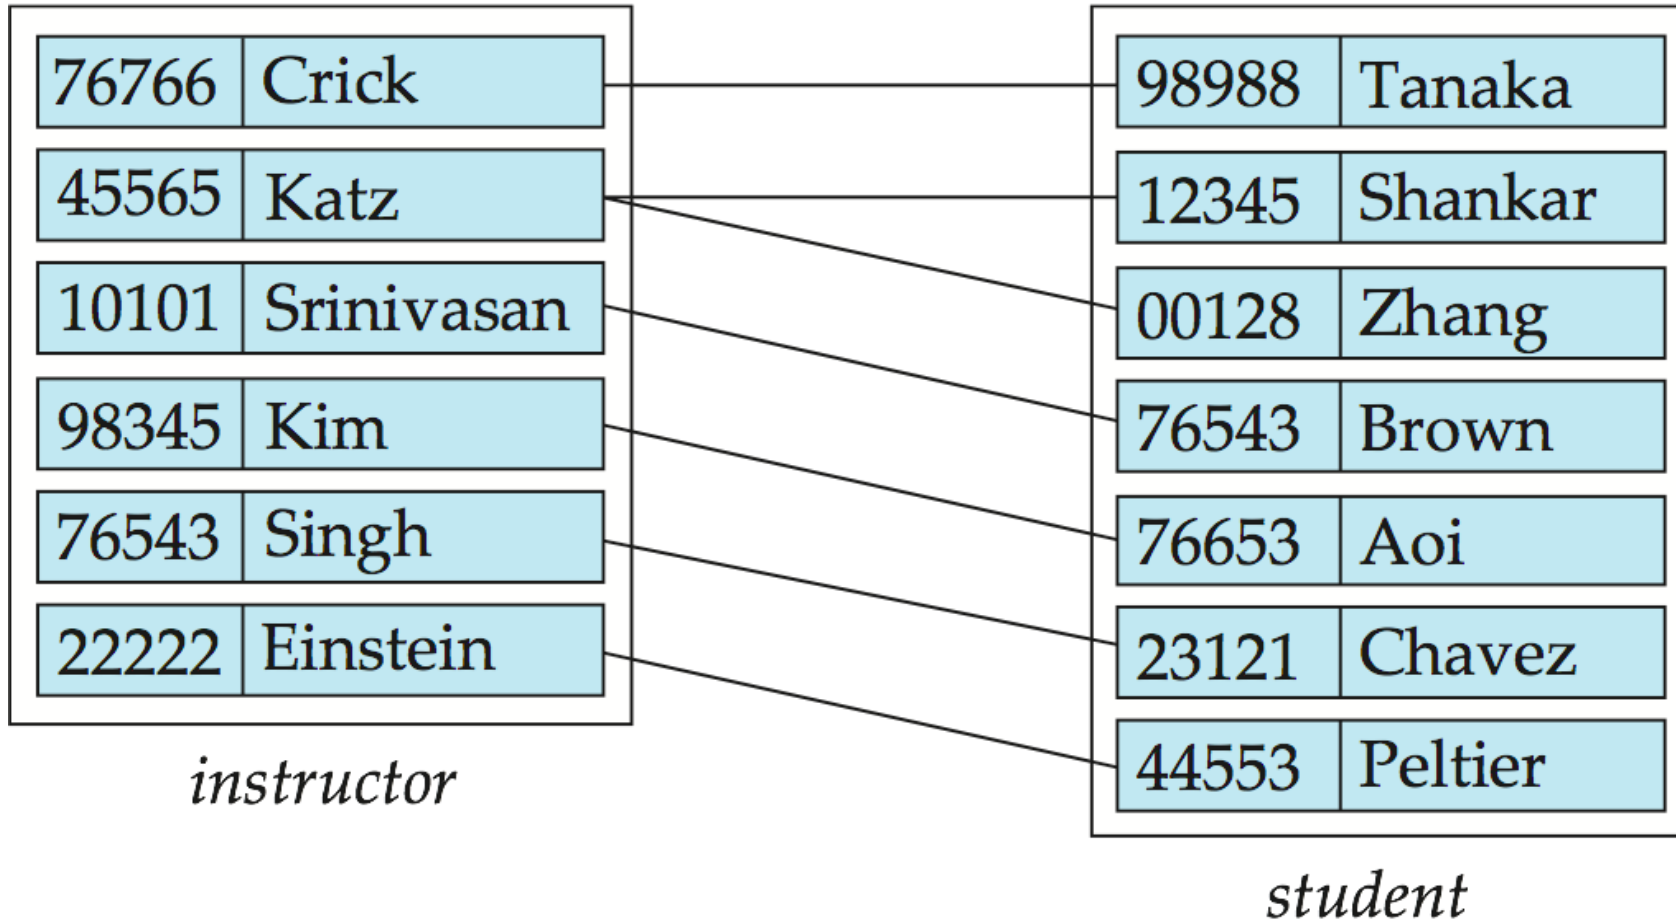

$$\{(e_1, e_2, \dots, e_n) \mid e_1 \in E_1, e_2 \in E_2, \dots, e_n \in E_n\}$$

where (e_1, e_2, \dots, e_n) is a relationship

– Example:

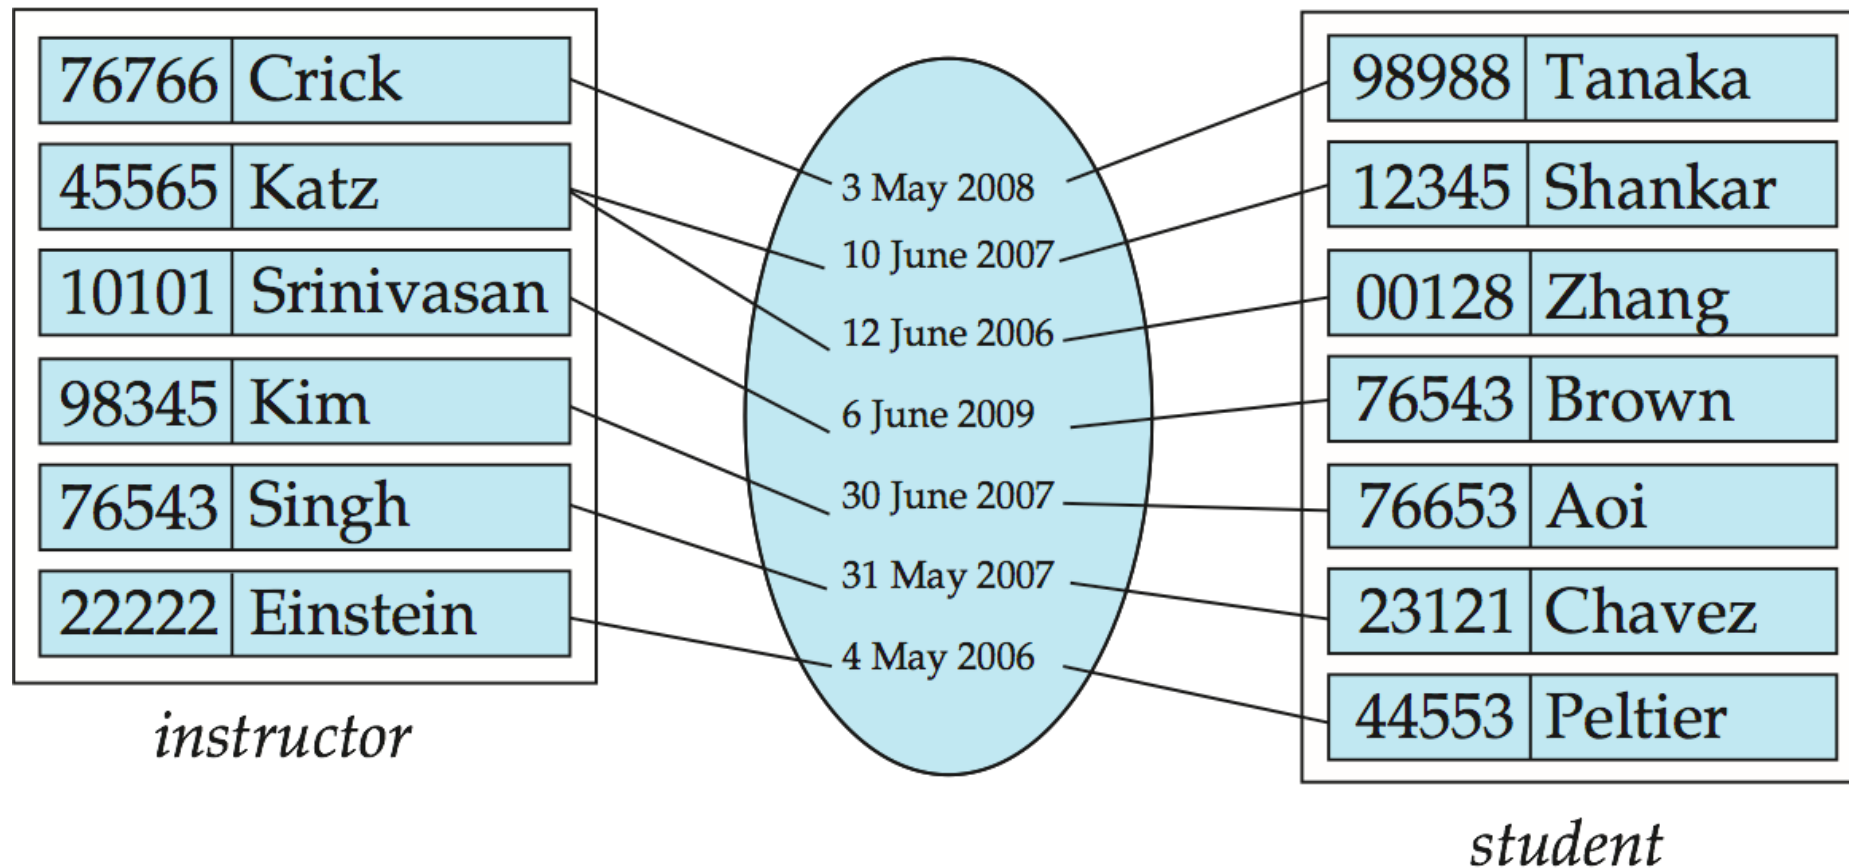

$$(44553, 22222) \in \text{advisor}$$

Relationship Set *advisor*

Relationship Sets (Cont.)

- An **attribute** can also be property of a relationship set.
- For instance, the *advisor* relationship set between entity sets *instructor* and *student* may have the attribute *date* which tracks when the student started being associated with the advisor

- Relationship may also have attributes → called **descriptive attributes**.
- E.g depositor has access-date
- Relationship to specify the most recent date on DEFAULT which customer accessed his account.

- Custid , custname,

- 1 xxx

- Custid,roomno, date, nodays

1	101	8-12-2019	3
---	-----	-----------	---

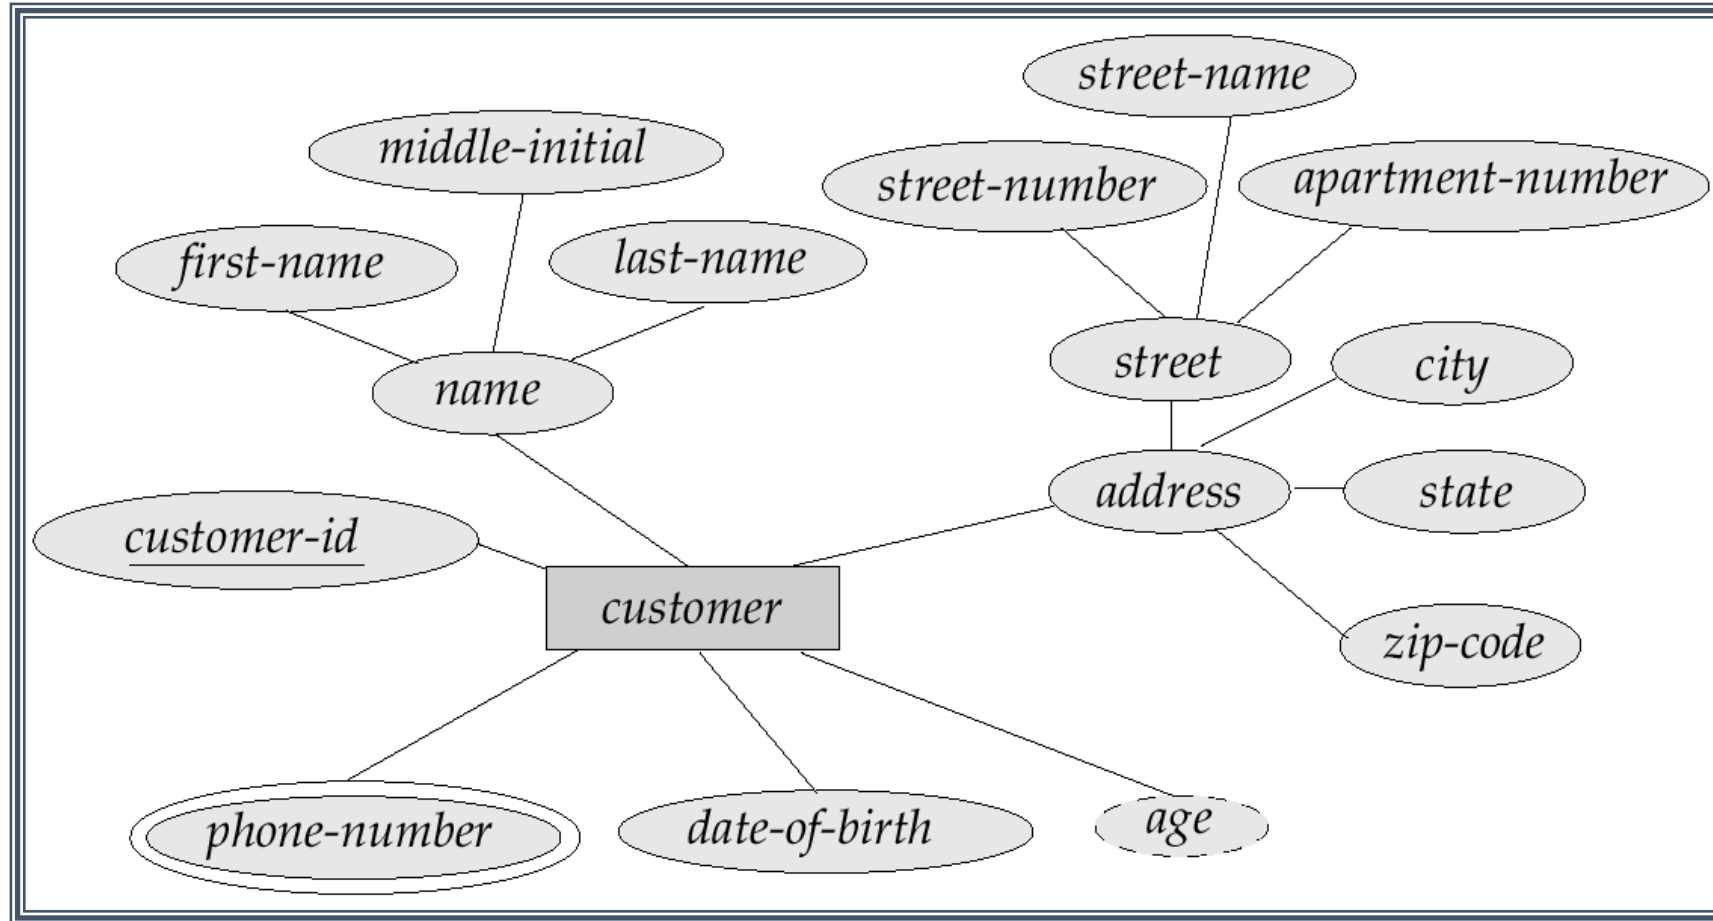

- 1 201 8-12-2020 2

E-R Diagrams

- **Rectangles** represent entity sets.
- **Diamonds** represent relationship sets.
- **Lines** link attributes to entity sets and entity sets to relationship sets.
- **Ellipses** represent attributes
 - **Double ellipses** represent multivalued attributes.
 - **Dashed ellipses** denote derived attributes.
- **Underline** indicates primary key attributes (will study later)

Entity with Composite, Multivalued, and Derived Attributes

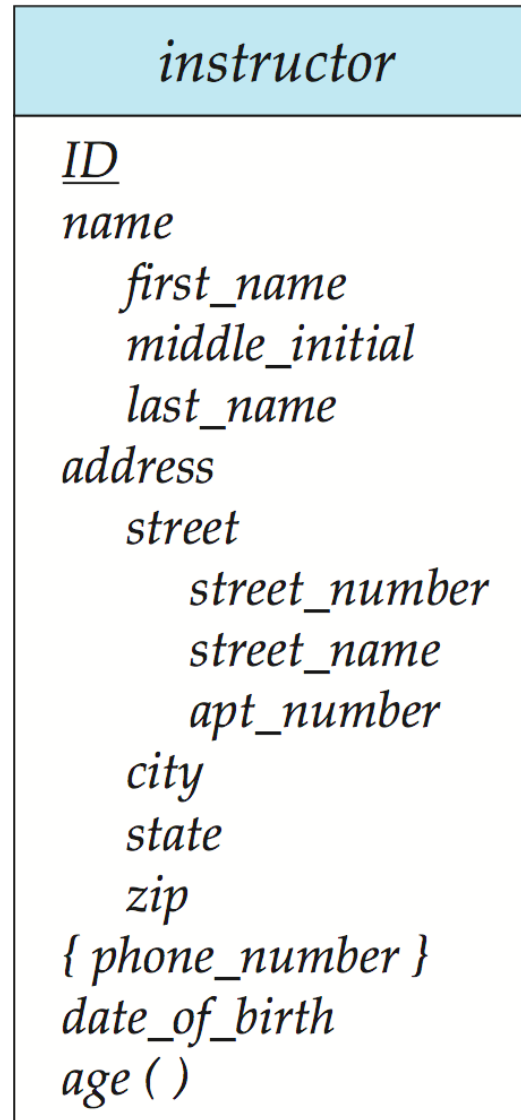

E-R Diagrams

Another Notation

- Rectangles represent entity sets.
- Diamonds represent relationship sets.
- Attributes listed inside entity rectangle
- Underline indicates primary key attributes

Entity With Composite, Multivalued, and Derived Attributes

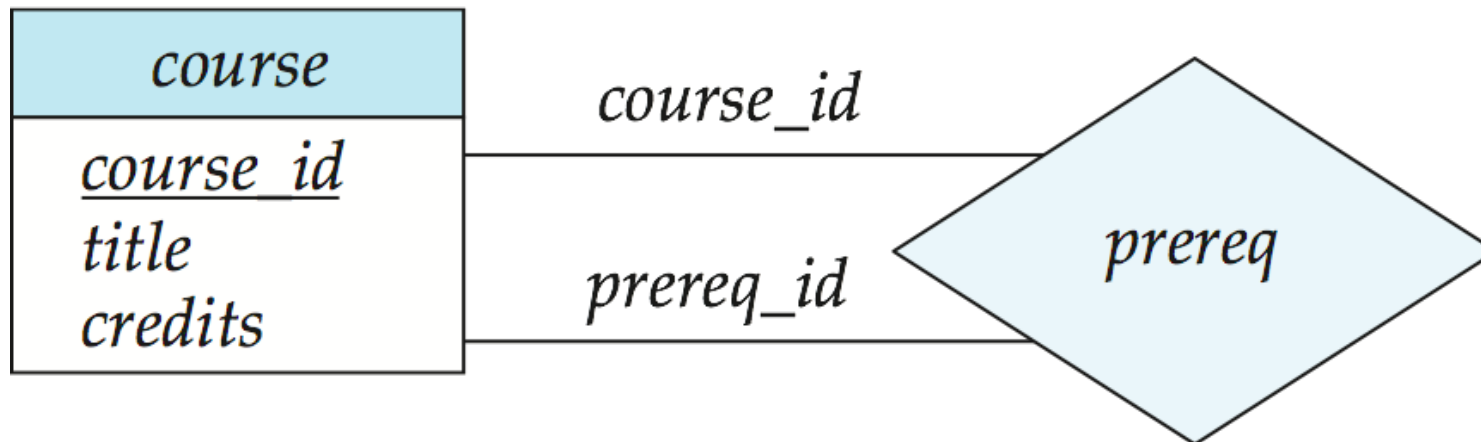

Relationship Sets with Attributes

Roles

- Entity sets of a relationship need not be distinct
 - Each occurrence of an entity set plays a “role” in the relationship
- The labels “*course_id*” and “*prereq_id*” are called **roles**.

Mapping Cardinality Constraints

- Express the number of entities to which another entity can be associated via a relationship set.
- Most useful in describing binary relationship sets.
- For a binary relationship set the mapping cardinality must be one of the following types:
 - One to one
 - One to many
 - Many to one
 - Many to many

Mapping Cardinalities

(a)

One to one

(b)

One to many

Note: Some elements in A and B may not be mapped to any elements in the other set

Mapping Cardinalities

(a)

Many to
one

(b)

Many to many

Note: Some elements in A and B may not be mapped to any elements in the other set

One-to-One Relationship

- one-to-one relationship between an *instructor* and a *student*
 - an instructor is associated with at most one student via *advisor*
 - and a student is associated with at most one instructor via *advisor*

One-to-Many Relationship

- one-to-many relationship between an *instructor* and a *student*
 - an instructor is associated with several (including 0) students via *advisor*
 - a student is associated with at most one instructor via *advisor*,

Many-to-One Relationships

- In a many-to-one relationship between an *instructor* and a *student*,
 - an *instructor* is associated with at most one *student* via *advisor*,
 - and a *student* is associated with several (including 0) *instructors* via *advisor*

Many-to-Many Relationship

- An instructor is associated with several (possibly 0) students via *advisor*
- A student is associated with several (possibly 0) instructors via *advisor*

Keys

- A **super key** of an entity set is a set of one or more attributes whose values uniquely determine each entity.
- A **candidate key** of an entity set is a minimal super key
 - *ID* is candidate key of *instructor*
 - *course_id* is candidate key of *course*
- Although several candidate keys may exist, one of the candidate keys is selected to be the **primary key**.

Keys for Relationship Sets

- The combination of primary keys of the participating entity sets forms a super key of a relationship set.
 - (s_id, i_id) is the super key of *advisor*
 - NOTE: *this means a pair of entity sets can have at most one relationship in a particular relationship set.*
 - Example: if we wish to track multiple meeting dates between a student and her advisor, we cannot assume a relationship for each meeting. We can use a multivalued attribute though
 - Must consider the mapping cardinality of the relationship set when deciding what are the candidate keys
 - Need to consider semantics of relationship set in selecting the *primary key* in case of more than one candidate key

Cardinality Constraints

- We express cardinality constraints by drawing either a directed line (\rightarrow), signifying “one,” or an undirected line ($-$), signifying “many,” between the relationship set and the entity set.
- One-to-one relationship:
 - A student is associated with at most one *instructor* via the relationship *advisor*
 - A *student* is associated with at most one *department* via *stud_dept*

Participation of an Entity Set in a Relationship Set

- **Total participation** (indicated by double line): every entity in the entity set participates in at least one relationship in the relationship set
 - E.g., participation of *section* in *sec_course* is total
 - ▶ every *section* must have an associated course
- **Partial participation**: some entities may not participate in any relationship in the relationship set
 - Example: participation of *instructor* in *advisor* is partial

Alternative Notation for Cardinality Limits

- Cardinality limits can also express participation constraints

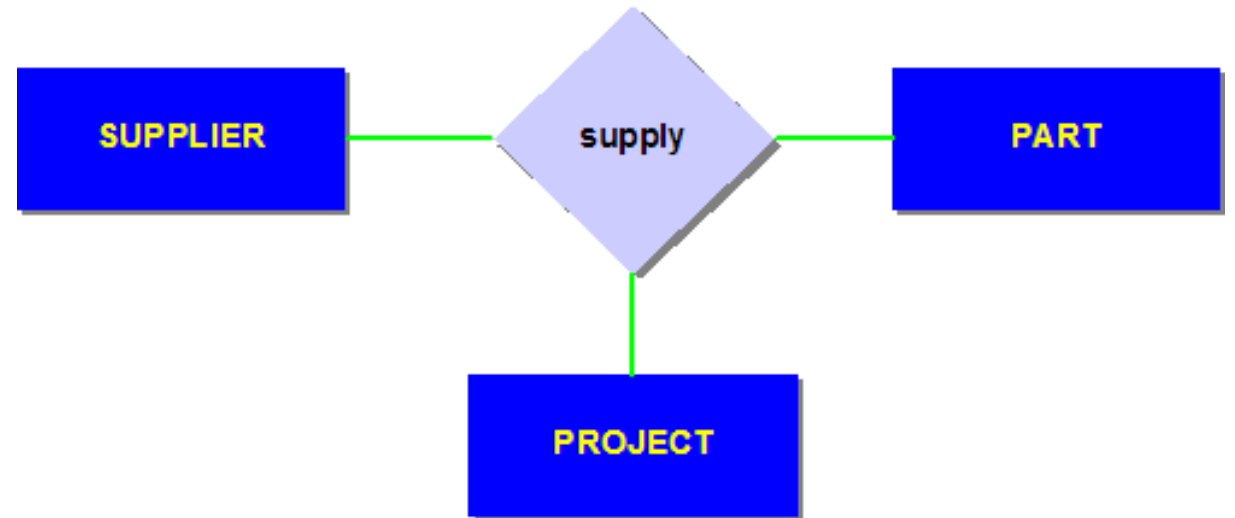

- Double line between the entity set “Student” and relationship set “Enrolled in” signifies total participation.
- It specifies that each student must be enrolled in at least one course.

- Single line between the entity set “Course” and relationship set “Enrolled in” signifies partial participation.
- It specifies that there might exist some courses for which no enrollments are made.

E-R Diagram with a Ternary Relationship (Degree of Relationship)

Participation of an Entity Set in a Relationship Set

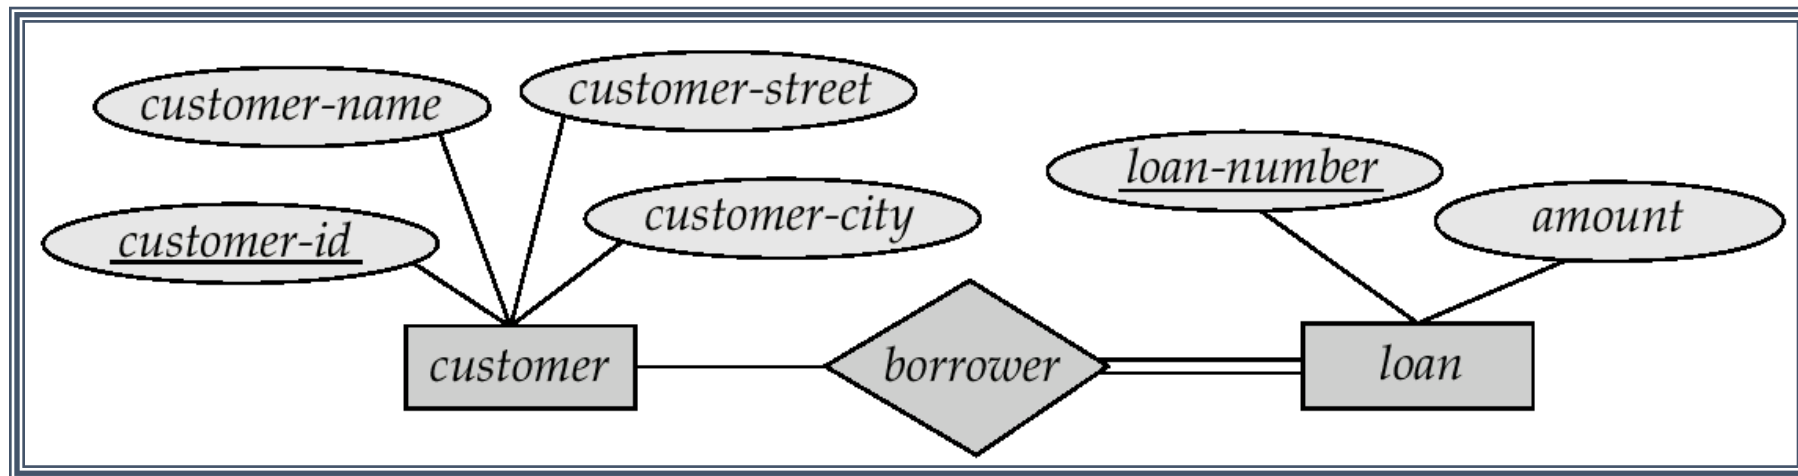

Total participation (indicated by double line): every entity in the entity set participates in at least one relationship instance in the relationship set

E.g. participation of *loan* in *borrower* is total

every loan must have a customer associated to it via borrower

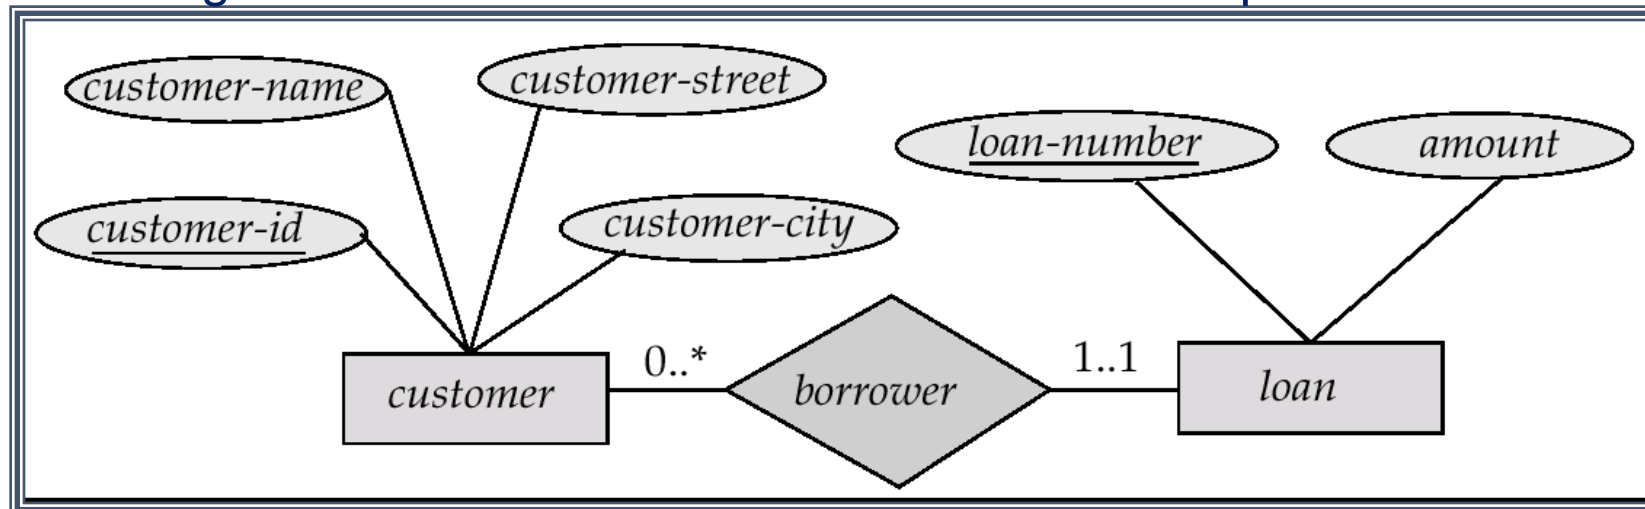

Partial participation: some entities may not participate in any relationship in the relationship set

E.g. participation of *customer* in *borrower* is partial

Alternative Notation for Cardinality Limits

- Cardinality limits can also express participation constraints.
- An edge between an entity set and relationship set can have an associated minimum and maximum cardinality.
- **l .. h** l is lower limit and h is higher limit.
- A minimum value 1 indicate a total participation of entity set into the relationship.
- in example each loan must have atleast one associated customer.
- Maximum /higher limit decide the cardinality of entity set. Like if both the side higher limit is 1 then it is one to one relationship

- Student enrolled in atleast one course. And can join more than one course So 1..*
- Some course dose not have any student enrrolledment.

- So mini student can enrrolled. in many

Keys

- A *super key* of an entity set is a set of one or more attributes whose values uniquely determine each entity instance. E.g cust_no is superkey for customer.
- Superkey may contains extra/more attributes.
- (e.g customer_name , cust_no)
- (customer_name,cust_no,cust_address)
- (cust_no,cust_address) are super keys

- A *candidate key* of an entity set is a minimal super key
 - *Customer-id* is candidate key of *customer*
 - *account-number* is candidate key of *account*
- Although several candidate keys may exist, one of the candidate keys is selected to be the *primary key*.

- E.g Employee have attribute
ssn,emp_id,emp_name
- So superkeys will be
- {ssn}
- {emp_id}
- {ssn,emp_id}
- {emp_id,emp_name}
- {ssn,emp_name}
- {ssn,emp_id,emp_name}

- **Candidate Key**

- {SSN}
- {Emp_id}
- Primary key can be any of the one from candidate key. i.e
ssn,emp_id can be a primary key

Keys for Relationship Sets

- The combination of primary keys of the participating entity sets forms a super key of a relationship set.
 - *(customer-id, account-number)* is the super key of *depositor(relationship)*
 - *(Stud_id, course_id)* is super key of relationship set *enrolled* –in
 - NOTE: this means a pair of entity sets can have at most one relationship in a particular relationship set.

- Must consider the mapping cardinality of the relationship set when deciding the what are the candidate keys
- Need to consider semantics of relationship set in selecting the *primary key* in case of more than one candidate key

Weak Entity Sets

- An entity set that does not have a primary key is referred to as a **weak entity set**.
- The existence of a weak entity set depends on the existence of a **identifying entity set**
 - It must relate to the identifying entity set via a total, one-to-many relationship set from the identifying to the weak entity set
 - **Identifying relationship** depicted using a double diamond
- The **discriminator** (*or partial key*) of a weak entity set is the set of attributes that distinguishes among all the entities of a weak entity set.
- The primary key of a weak entity set is formed by the primary key of the strong entity set on which the weak entity set is existence dependent, plus the weak entity set's discriminator.

Weak Entity Sets (Cont.)

- We underline the discriminator of a weak entity set with a dashed line.
- We put the identifying relationship of a weak entity in a double diamond.
- Primary key for *section* – (*course_id*, *sec_id*, *semester*, *year*)

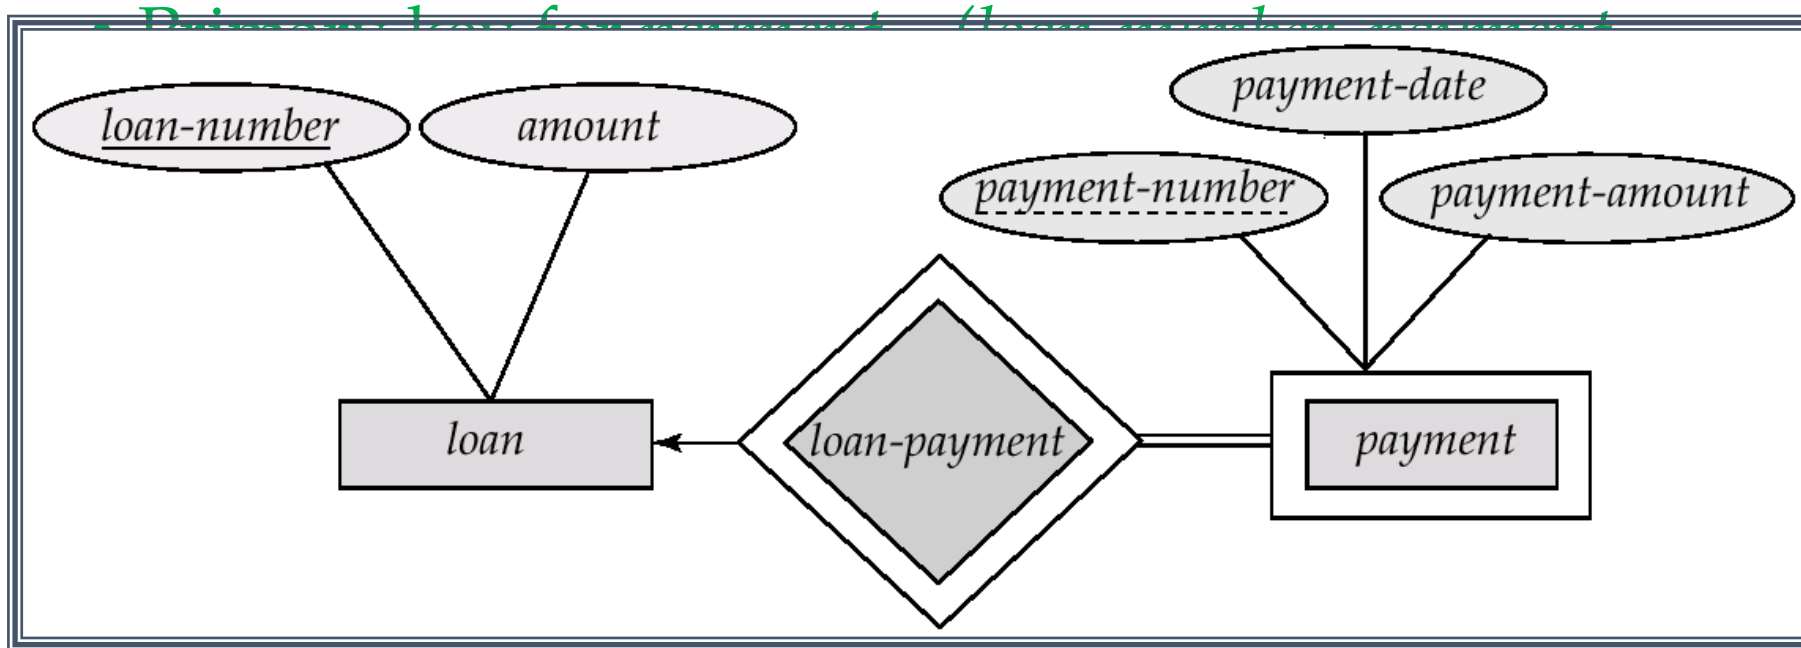

Weak Entity Sets (Cont.)

- Note: the primary key of the strong entity set is not explicitly stored with the weak entity set, since it is implicit in the identifying relationship.
- If *course_id* were explicitly stored, *section* could be made a strong entity, but then the relationship between *section* and *course* would be duplicated by an implicit relationship defined by the attribute *course_id* common to *course* and *section*

Weak Entity Sets (Cont.)

- We depict a weak entity set by double rectangles.
- underline the discriminator of a weak entity set with a dashed line.
- *payment-number* – **discriminator** of the *payment* entity set

- loan_number, pay_number

1	1	
1	2	
2	1	sdfssf
2	2	

Weak Entity Sets (Cont.)

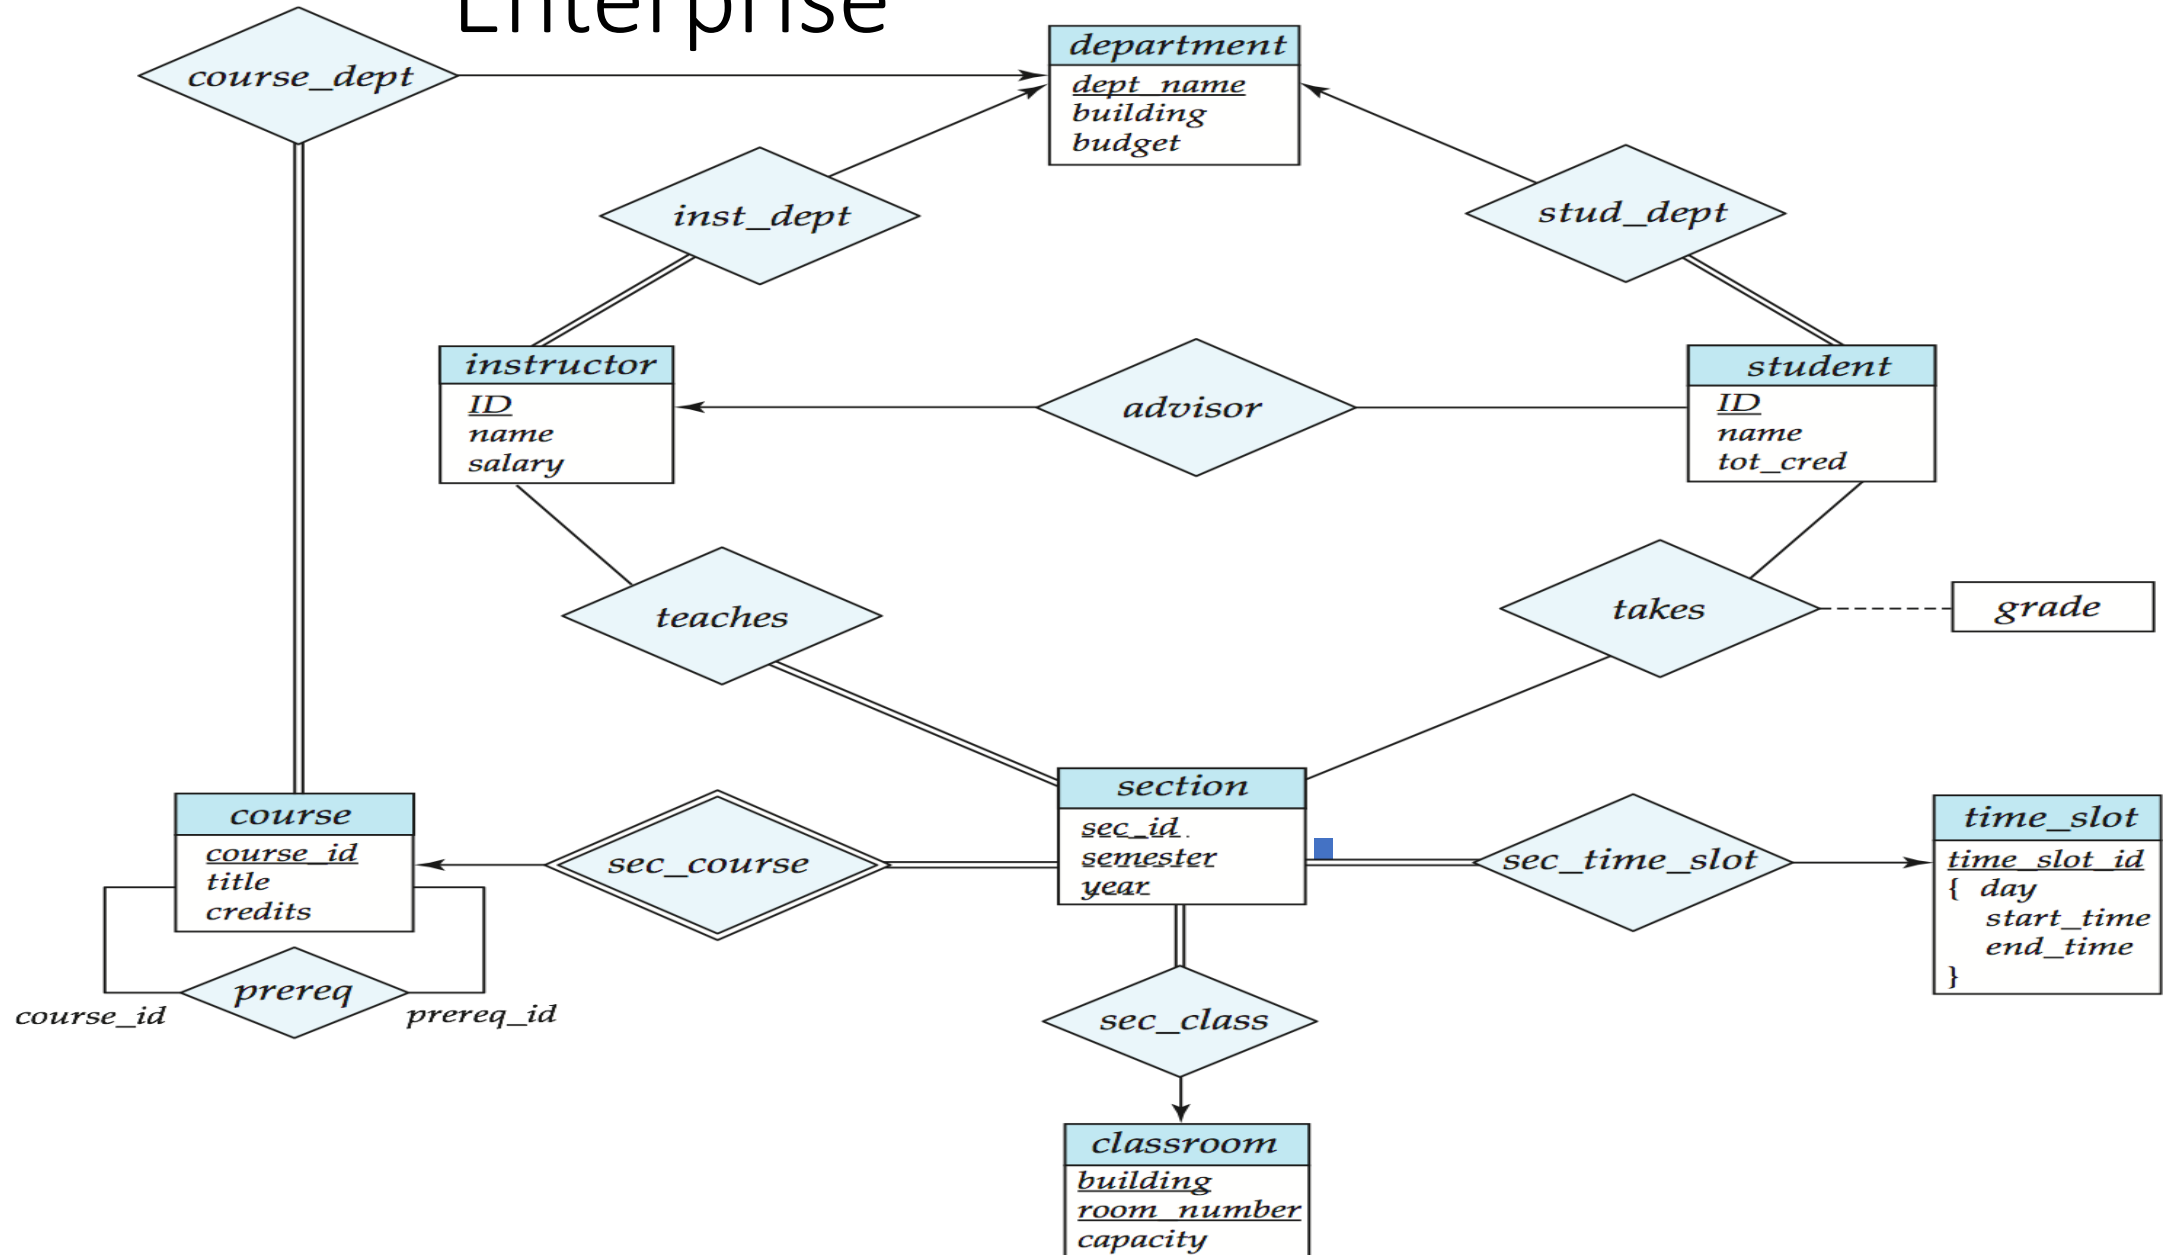

- Loan is strong entity
- Payment is weak entity. As every payment is is exists if loan is exists.
- Payment number is discriminator so strong entity's primary key loan_number and payment_number both combinedly find the uniq instance
- Payment entity have total participation has every loan have atleast minimum one payment installment.
- The primary key of the strong entity set is not explicitly stored with the weak entity set, since it is implicit in the identifying relationship.

More Weak Entity Set Examples

- Team is strong entity having team number.
- Player is weak entity.
- Without team player does not exist. [player does not play independently without team]
- At least minimum one player for play. So player to play-on is total participation

E-R Diagram for a University Enterprise

Entity set E with
attributes A1, A2, A3
and primary key A1

E	
A1	
A2	
A3	

Many to Many
Relationship

One to One
Relationship

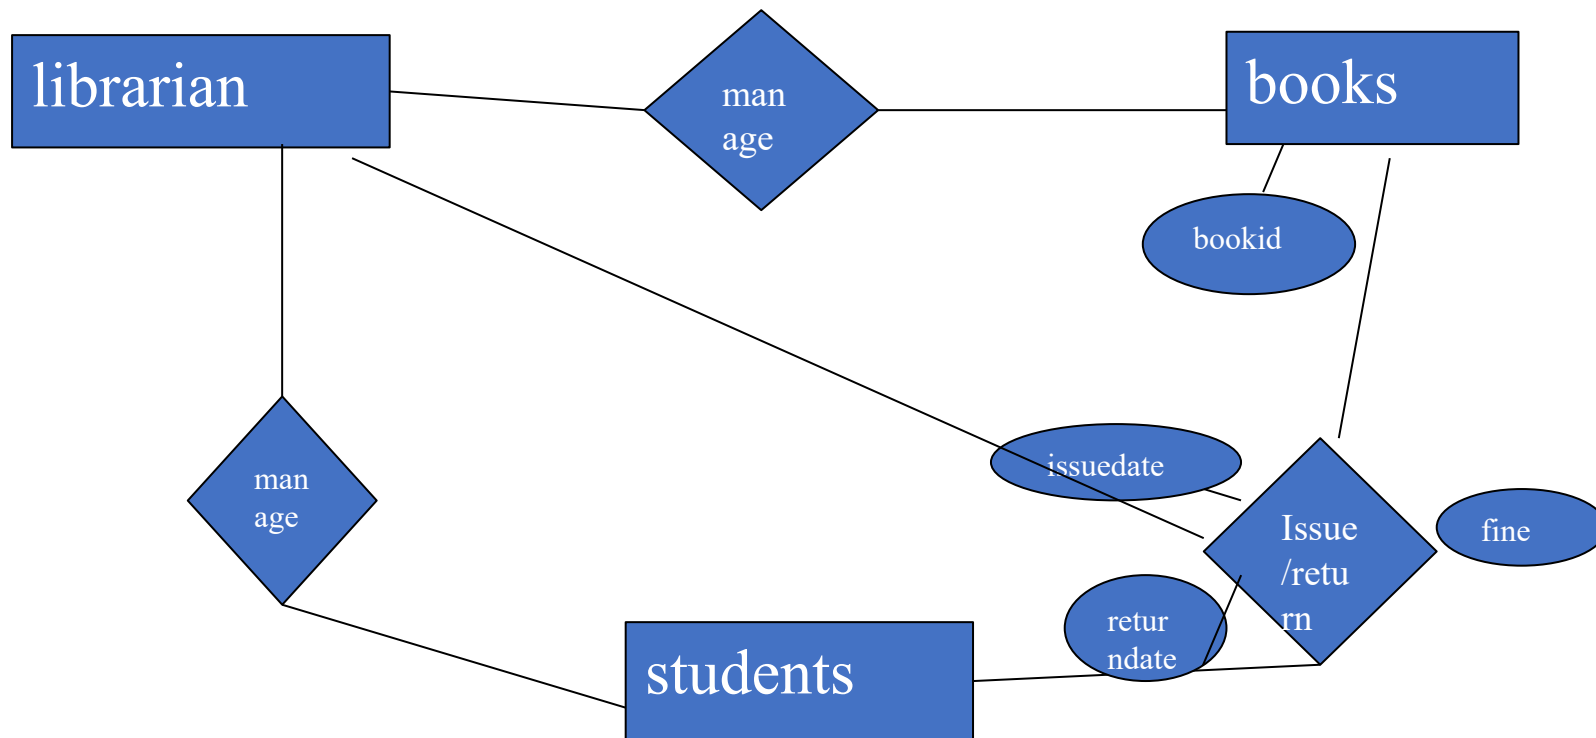

Many to One
Relationship

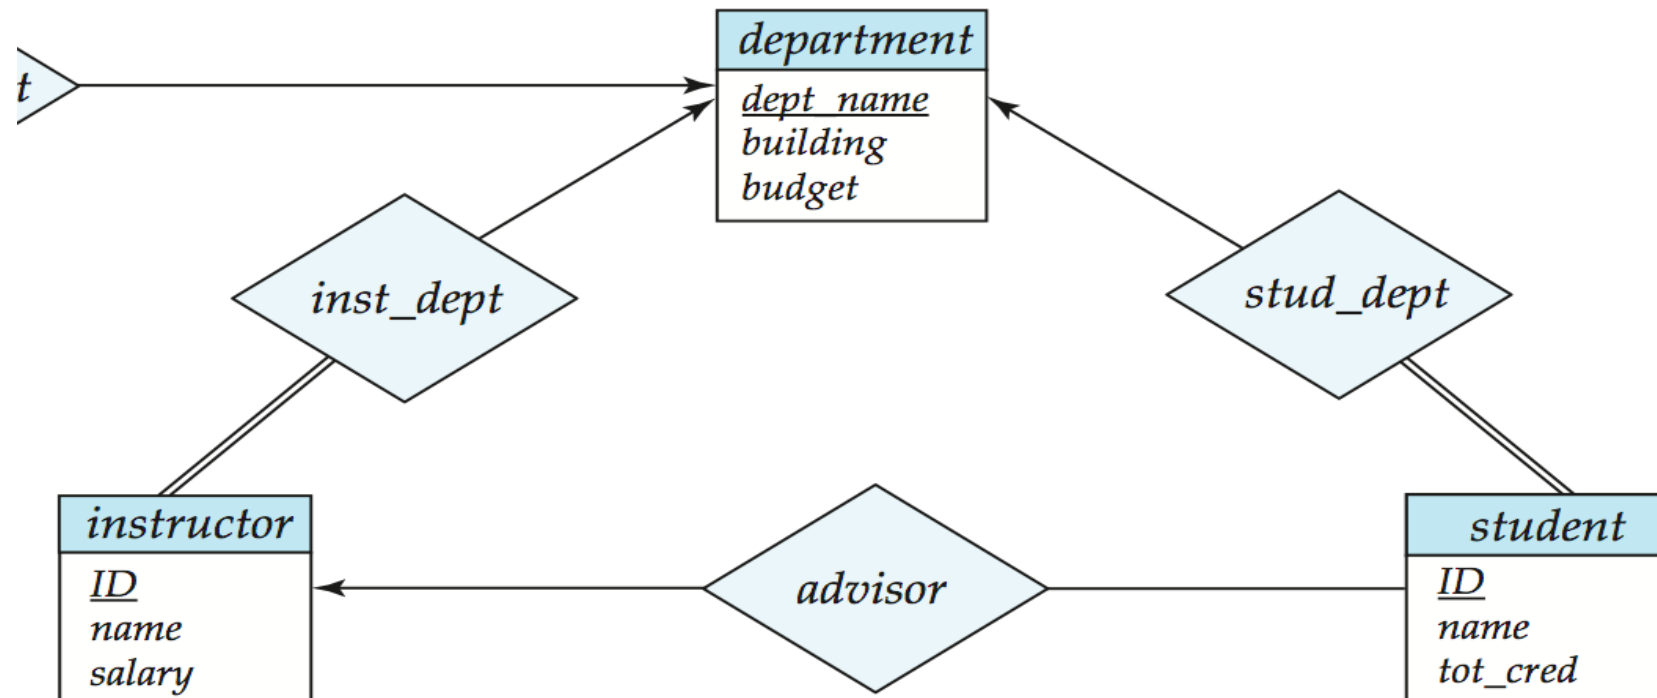

Example

- Draw the ER diagram for following
 - There are many librarian into the library
 - Students can issue and returns the books.
 - At the time of return the book fine is calculate.
 - Librarian can mange the books and students

Redundancy of Schemas

- Many-to-one and one-to-many relationship sets that are total on the many-side can be represented by adding an extra attribute to the “many” side, containing the primary key of the “one” side
- Example: Instead of creating a schema for relationship set *inst_dept*, add an attribute *dept_name* to the schema arising from entity set *instructor*

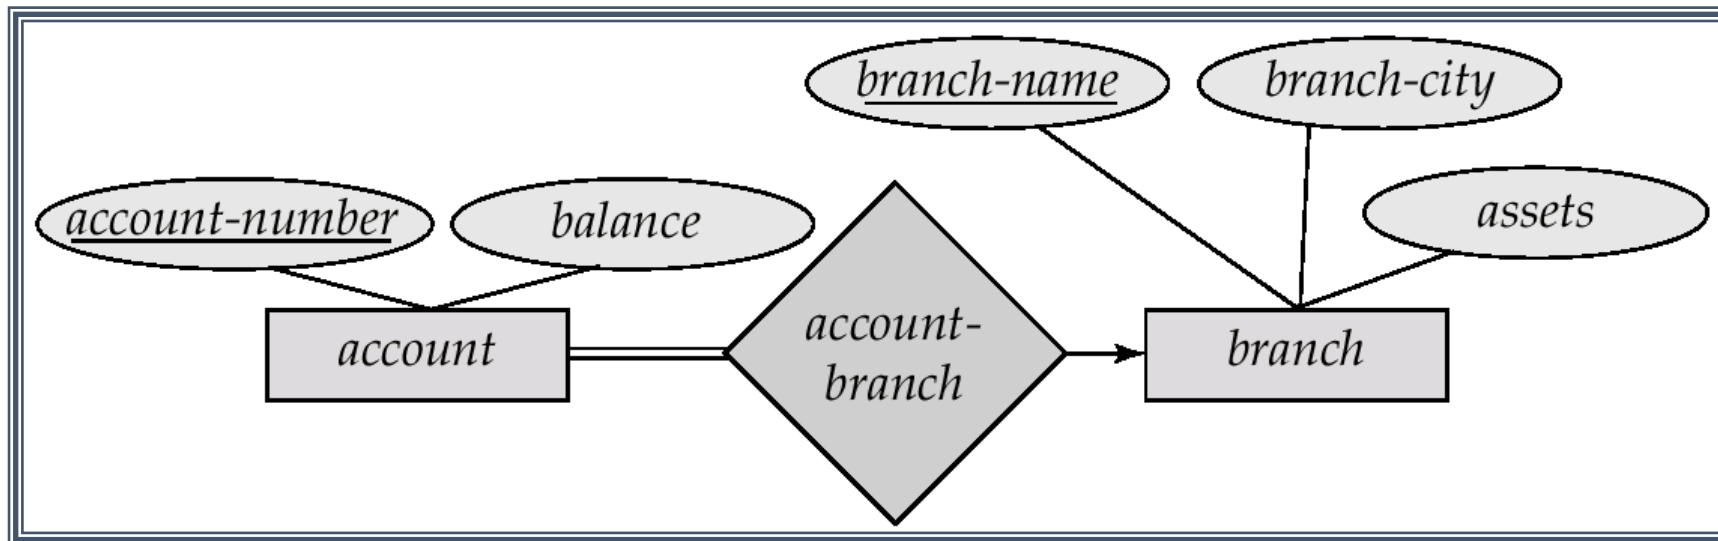

Redundancy of Schemas (Cont.)

- For **one-to-one relationship** sets, either side can be chosen to act as the “many” side
 - That is, extra attribute can be added to either of the tables corresponding to the two entity sets

Redundancy of Tables

- Many-to-one and one-to-many relationship sets that are total on the many-side can be represented by adding an extra attribute to the many side, containing the primary key of the one side
- E.g.: Instead of creating a table for relationship *account-branch*, add an attribute *branch* to the entity set *account*

Representing Relationship Sets as Tables

- A many-to-many relationship set is represented as a table with columns for the primary keys of the two participating entity sets, and any descriptive attributes of the relationship set.
- E.g.: table for relationship set *borrower*

<i>customer-id</i>	<i>loan-number</i>
019-28-3746	L-11
019-28-3746	L-23
244-66-8800	L-93
321-12-3123	L-17
335-57-7991	L-16
555-55-5555	L-14
677-89-9011	L-15
963-96-3963	L-17

- Example: schema for relationship set *advisor*
advisor = (*s_id*, *i_id*)

Composite and Multivalued Attributes

<i>instructor</i>
<u>ID</u>
<i>name</i>
<i>first_name</i>
<i>middle_initial</i>
<i>last_name</i>
<i>address</i>
<i>street</i>
<i>street_number</i>
<i>street_name</i>
<i>apt_number</i>
<i>city</i>
<i>state</i>
<i>zip</i>
{ <i>phone_number</i> }
<i>date_of_birth</i>
<i>age</i> ()

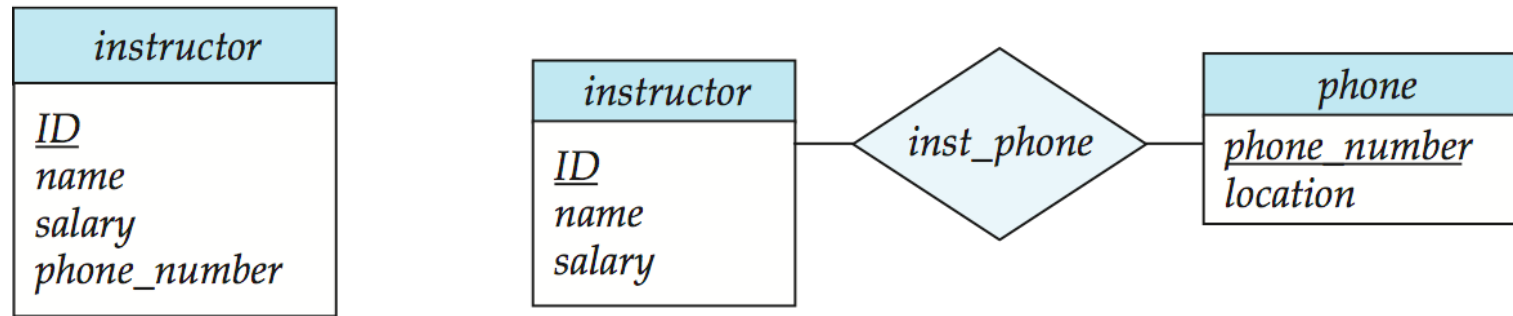

- Composite attributes are flattened out by creating a separate attribute for each component attribute
 - *instructor*(ID, *first_name*, *middle_initial*, *last_name*, *street_number*, *street_name*, *apt_number*, *city*, *state*, *zip_code*, *date_of_birth*)

Composite and Multivalued Attributes

- A multivalued attribute M of an entity E is represented by a separate schema EM
 - Schema EM has attributes corresponding to the primary key of E and an attribute corresponding to multivalued attribute M
 - Example: Multivalued attribute $phone_number$ of $instructor$ is represented by a schema:
 $inst_phone = (\underline{ID}, \underline{phone_number})$
 - Each value of the multivalued attribute maps to a separate tuple of the relation on schema EM

Design Issues

- Use of entity sets vs. attributes

- Use of phone as an entity allows extra information about phone numbers (plus multiple phone numbers)

Representing Weak Entity Sets

- A weak entity set becomes a table that includes a column for the primary key of the identifying strong entity set
- A strong entity set reduces to a schema with the same attributes
student(ID, name, tot_cred)
- A weak entity set becomes a table that includes a column for the primary key of the identifying strong entity set
section (course_id, sec_id, sem, year)

No need to create table for the relationship

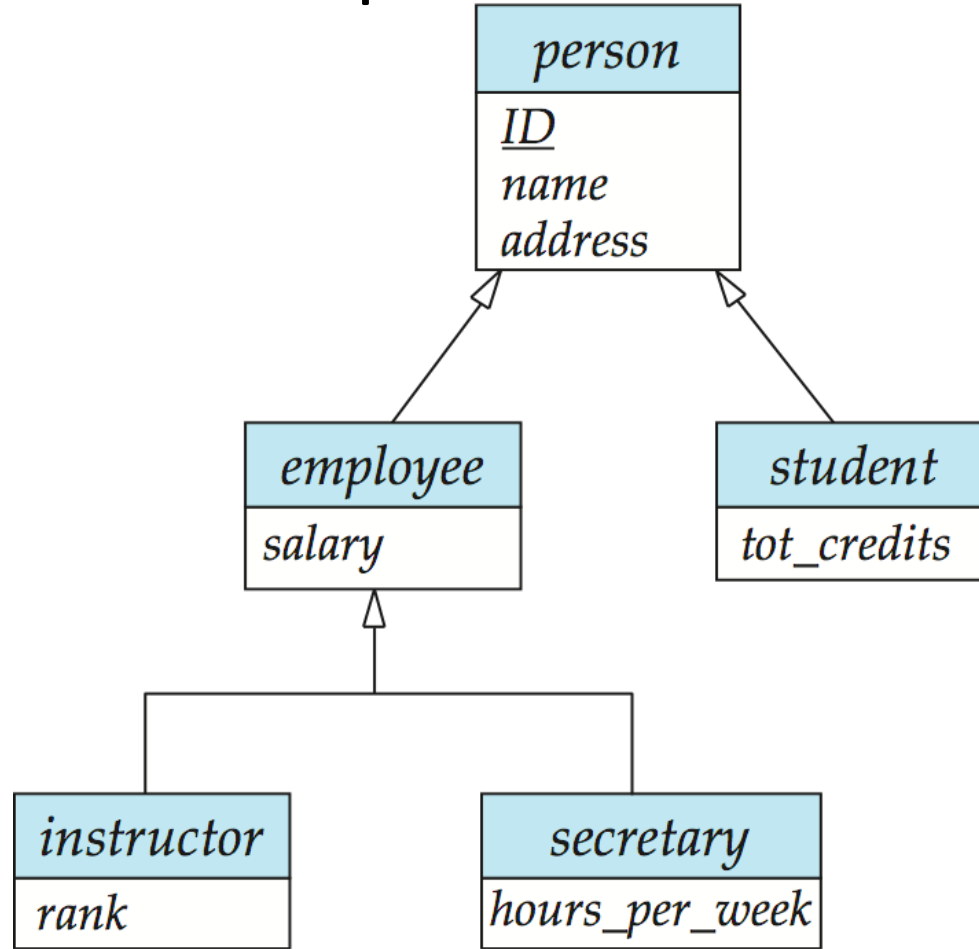

Extended ER Features

Extended E-R Features: Specialization

- Top-down design process; we designate subgroupings within an entity set that are distinctive from other entities in the set.
- These subgroupings become lower-level entity sets that have attributes or participate in relationships that do not apply to the higher-level entity set.
- Depicted by a *triangle* component labeled ISA (E.g., *instructor* “is a” *person*).
- **Attribute inheritance** – a lower-level entity set inherits all the attributes and relationship participation of the higher-level entity set to which it is linked.

Specialization Example

Extended ER Features: Generalization

- **A bottom-up design process** – combine a number of entity sets that share the same features into a higher-level entity set.
- Specialization and generalization are simple inversions of each other; they are represented in an E-R diagram in the same way.
- The terms specialization and generalization are used interchangeably.
